INVESTOR OVERVIEW · NOVEMBER 2026

CoRoute: the safety and coordination layer for India's riders

A free, phone-only safety app for motorcycle riders, with paid group coordination. Version 3.55 is code-complete and heading into device testing and launch.

No hardware needed | Safety free forever | Freemium group plans | Near-zero infrastructure cost | Privacy by design | Hears sirens and horns | Friends, crews, leaderboards

10. Go-to-market
11. Status, risks and the ask

Two-wheeler riders are India's most exposed road users

1,72,890
people died in road accidents in India in 2023

44.8%
of them were two-wheeler riders (≈ 77,000 lives)

19.61 M
two-wheelers sold in India in FY2025 (12.25 M motorcycles)

Most of these riders carry a smartphone, yet almost none of it is used for their safety. When a rider crashes alone on a highway at night, help depends on someone passing by. In groups, riders lose each other at the first junction, run out of fuel, or ride on unaware that a friend has stopped.

Riders tell us they need

- Someone to know when they fall, even if they cannot call.
- A group that stays together without constant phone calls.
- Fuel, food and hospitals they can trust on unfamiliar roads.
- Something that works where signal is weak.

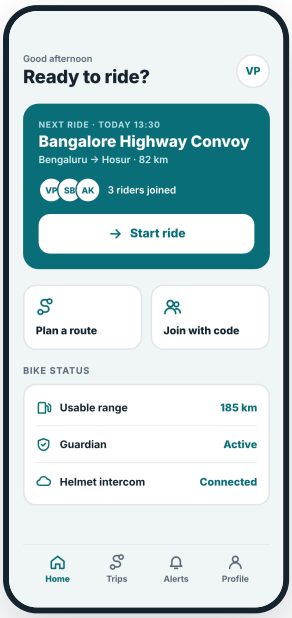

Why now

- Leisure and touring riding is growing fast: Royal Enfield alone crossed 1 million sales in FY2025.
- Phones now carry the sensors (accelerometer, gyroscope, GPS) needed for crash detection.
- Riding clubs organise on WhatsApp, with no safety tooling at all.

BUILT · ILLUSTRATION

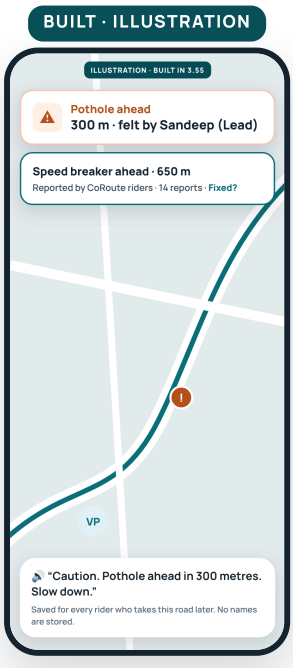

Admin feature switches

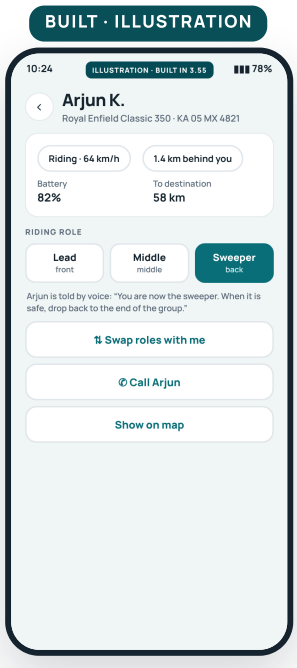

Plan → ride solo or with a group → be protected on the road → come home with a story. Plus usernames, friends and crews between rides, a private rider score, an admin console with a marketing studio, and a public website with all-time, privacy-safe impact numbers and leaderboards.

Safety for everyone, coordination for groups

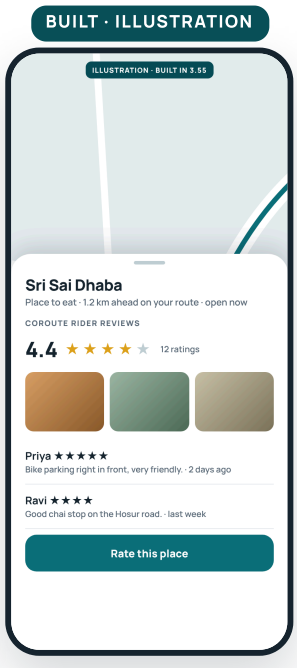

COROUTE	TYPICAL ALTERNATIVES
Phone only. Crash detection, bike-down check, road hazard detection from the phone's own sensors.	Crash-detecting helmets and devices cost thousands of rupees.
Safety free forever. Every safety feature on the free Community plan.	Safety features often sit behind premium tiers.
Built for groups. Live map, intercom, Lead/Middle/Sweeper roles, regroup, missing-rider and stretch alerts, buddy pairs.	WhatsApp location sharing and phone calls.
Built for Indian roads. Fuel by type (petrol/CNG/EV), dhabas and stays, speed breakers and potholes, rider reviews of places, historic places on the way.	Generic navigation apps.
Rider-first sound. Hears sirens and close horns with the phone's own mic and tells riders in noise-cancelling earbuds or a helmet set; lowers music when speeding; holds ride voice during calls but lets emergencies through; cleans wind and breath out of the group intercom.	Helmet intercoms and music apps that know nothing about the ride.
Weak-signal first. Saved route maps, SMS fallback for SOS, queued messages, solo check-in by ETA, no-signal-ahead notices.	Most apps fail silently without data.
Community data that compounds. Every ride makes the map safer: road hazards, hard-brake hot spots and place reviews, anonymous and rounded (10+ riders behind any public number).	No shared rider intelligence.
Operationally light. Two always-free cloud VMs with live failover; logic runs on the phone, the server relays.	Expensive per-user backends.

Community road warnings

Riding roles

Rider reviews

Version 3.55: code-complete

70+
rider, group and community features

66
features an admin can switch off live (4 safety ones locked on)

904 / 904
automated server tests passing

2
cloud servers with live failover

AREA	BUILT
Safety	Crash detection (learns per bike), SOS with SMS fallback, bike-down check, Medical ID (always given to responders during an emergency), guardian live link + arrival message, solo check-in by ETA, SOS battery reserve, fatigue score, night and altitude care, sharp-bend and speed-limit warnings, road hazards and hard-brake hot spots
Sound and calls	Emergency-vehicle siren and horn alerts for riders with earbuds or a helmet set, music lowered for alerts and when speeding, call-aware alerts, lock-screen ride controls (Talk / Mute), intercom voice cleanup, settings that apply live mid-ride
Groups	Live map with bike-shape markers (two riders when a pillion is seated), intercom, Trip owner / Trip head management, Lead/Middle/Sweeper roles and automatic roles, regroup, stretch alert with smart regroup point, missing-rider check with hold-to-send SOS, break planner, buddy pairs, roll call, route to group, pillion seat, bike and pillion swap
Community	Unique usernames, profiles with ride analytics and pictures, friends by username or invite link (mutual approval, blocks), crews with polls (no chat), crew ride invitations (pick members, they accept from a notification), push notifications when the app is closed, private rider score with tips, public leaderboards by username with opt-out
Navigation	Speed from a filtered GPS estimator (one number for the display and the speed warning; 7 accuracy fixes in 3.55)
Places	Fuel by type and range, hospitals and mechanics, rider reviews with photos, historic places on the way
Business	Free Community plan, Small and Large Group plans with prorated upgrades and coupons (Razorpay), marketing studio for coupon campaign images, admin console with plans, payments, moderation (incl. crews and profile pictures) and feature switches
Platform	Android app (iOS building), Node.js gateway on Oracle Cloud free tier with two-VM failover, encrypted backups, own domain coroute.devmonks.space (old address kept as an automatic fallback), push notifications (Firebase), privacy-safe public website with all-time totals and leaderboards

Honest status. Built and verified with automated tests and code analysis. The newest sound and call features also need their Android native code compiled and checked on phones; the new community screens, bike markers, pillion flow, push notifications (after the Firebase project is set up) and the domain move need a check on real phones. Next: final build, real-road testing on several phones, production deploy, Play Store launch. iPhone is in development.

The phone becomes the rider's ears

Riders with noise-cancelling earbuds, helmet sets and music hear less of the road. 3.55 gives the phone ears, with no extra hardware: its own microphone hears the ambulance and CoRoute says it in the rider's ears. All on the phone.

1.9–2.9 s
to detect a siren 13 dB under the ride noise (synthetic)

0
false siren or horn alerts in 20 min of synthetic road audio

−30 dB
breath in intercom voice (wind gusts −34.5 dB); speech changed < 1 dB

12 ms
added intercom delay from voice cleanup

SHIPPED IN 3.55	WHAT IT DOES	ADMIN SWITCH
Siren alerts	Wail, yelp and hi-lo (incl. Indian ambulance hi-lo); approaching / moving away; "keep left and give way" in the earbuds or helmet when the rider can't hear outside	sirenDetector
Horn alerts	"Horn close by. Check your mirrors." when earbuds, a helmet set or music may hide traffic	hornAlert
Clear intercom	Wind, engine, noise and breath removed; hands-free sends nothing on breath or wind	voiceCleanup
Music and alerts	Alerts lower music; emergencies pause it and play in the headset, or at alarm volume (even in DND)	—
Lower music when speeding	60% at 10% over, 30% at 25%, paused at 40%; back when under	speedAudio
Call-aware alerts	Ride voice waits during calls; critical alerts still get through; catch-up after the call	callAwareAlerts
Lock screen	Speed, limit, next warning, intercom state; Talk and Mute without unlocking	—
Live settings	Every setting applies mid-ride; stricter speed limit wins; bike colour updates live	riderVehicleLive

MOCK-UP · 3.55

Siren card and spoken alert

How to read these numbers. They are **lab results on synthesised audio** (engine, wind, speech, music and sirens mixed in software), run on the same code as the automated tests, not real-road results. Known limits: a phone in a pocket at speed may not hear a siren; one microphone cannot tell direction, so alerts never say "behind"; the Android native audio code still has to be compiled and checked on phones before launch.

6 · NEW IN 3.55: COMMUNITY AND GROWTH LOOP

Riders bring friends, friends form crews

Between rides CoRoute now gives riders a name, friends and a crew. Every piece feeds the next ride, and every ride feeds the loop.

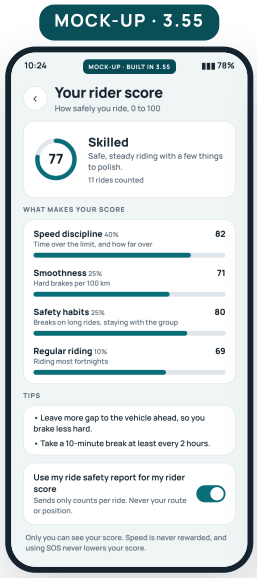

Username automatic and unique → **Invite link** opens the app or the store → **Friends** both agree → **Crew poll** "When shall we ride?" → **Ride invite** push, one-tap Accept → **Group ride** one host plan, friends free → **Score, boards** a reason to ride again

BUILT	WHAT IT DOES	ADMIN SWITCH
Usernames, profiles	Unique username for every rider (e.g. SwiftFalcon482); profile with picture and ride analytics (trips, km, hours, longest trip, largest group, score)	profilePhotos (pictures; usernames are core)
Friends	By username or personal invite link; mutual approval; silent blocks; never phone, e-mail, medical info or location to others	friends
Crews and polls	Standing circles of friends (crew admin, co-admins, members, up to 100); invitation only; polls only, no chat to moderate	crews, crewPolls
Crew rides, push	The host invites chosen crew members; they join from a notification with Accept (no code). Friend, crew and poll notifications reach riders with the app closed	crewRides, pushNotifications
Leaderboards	Top score, longest ride, most km, hours and rides; by username only, with opt-out; in the app and on the website	leaderboard
Rider score	Private 0–100 safety score with levels and tips	riderScore

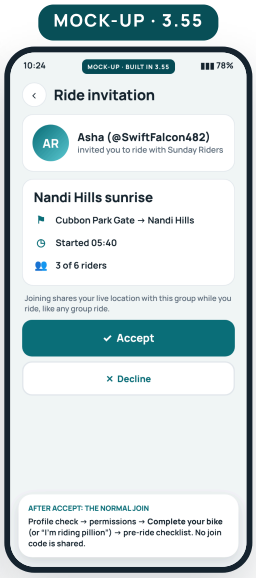

Rider score: a safety incentive, not a speed game

Built from speed discipline (40%), smoothness (25%), safety habits (25%) and regular riding (10%), with levels Learner, Steady, Skilled and Ace Rider and personal tips.

- Riding over the limit lowers it; going faster never raises it.
- Using SOS or having a crash never lowers it.
- It unlocks after 3 rides of 10 km or more, so riders come back; the top-score board makes safe riding the thing to show off.
- Base for future partner offers (insurance, roadside help), shared only if the rider chooses.

Rider score

Crew ride invitation

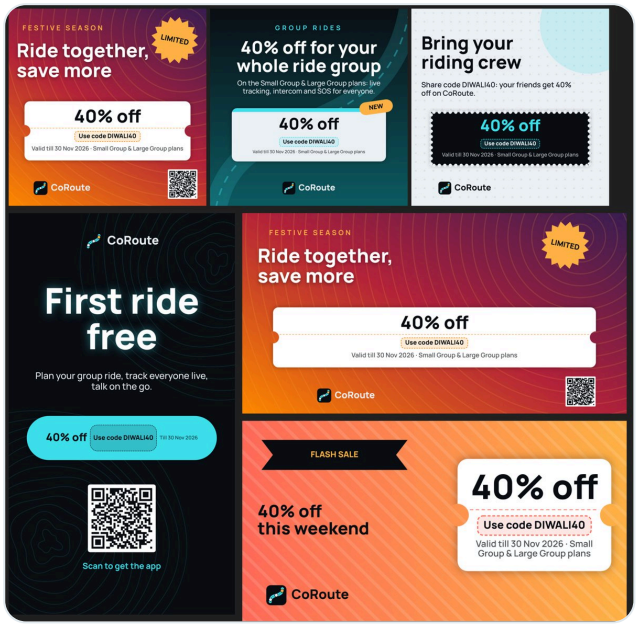

Gateway tests for these features pass. Screens are mock-ups drawn from the app's code; phone checks pending.

Market with real coupons, prove it with real numbers

Marketing studio (admin console)

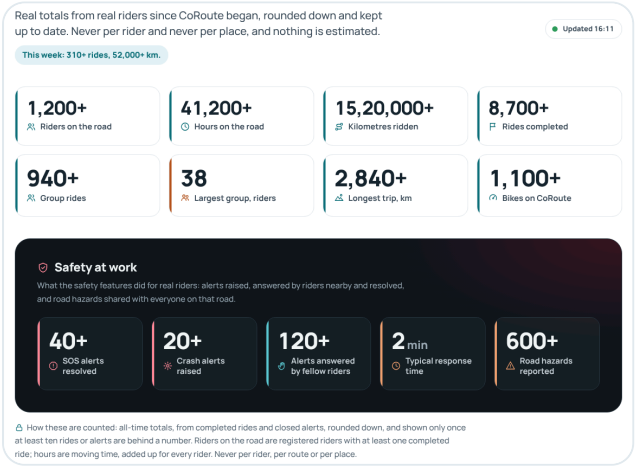

The team makes coupon and offer posts inside the admin console, without a designer or another tool. Start from a template (festive offer, group plan discount, first ride free, referral, weekend flash sale) or a blank canvas, **bind a live coupon** and its code, discount, validity and plan fill in by themselves and follow later coupon edits. Add text, logo, badges, images and a **QR code** to the download page; export a 1080×1080 post, a 1080×1920 story / WhatsApp status and a 1200×628 banner in one go, with a ready caption to share.

- Admin only; no rider data in templates; expired or paused coupons ask before export; every change in the audit log.
- Limits today: the QR link opens the download page, but the coupon is still typed by the rider; the editor needs a check on a device.

Starter templates bound to a sample coupon (rendered by the visual-check copy of the studio's painter).

Website: all-time impact

REAL WEBSITE SCREENSHOT sample data, desktop light theme

The home page now shows totals **since CoRoute began**: riders on the road, hours on the road, kilometres, rides, group rides, largest group, longest trip and bikes, plus what the safety features did (SOS resolved, crash alerts, alerts answered by fellow riders, road hazards) and a "this week" line. A **leaderboards** page shows the top 10 riders by username.

- Computed by one server every 5 minutes and served by both; rounded down and hidden until at least 10 rides or alerts are behind a number.
- Never per rider, route or place. Leaderboards appear once riders pass the 3-ride rule.

8 · BUSINESS MODEL

Free safety builds trust; groups pay for coordination

STREAM	HOW IT WORKS	STATUS
Group plans	Small Group (2–6) ₹49/month, Large Group (7–12) ₹99/month (default catalogue prices). Only the host pays; friends join free and get the host's group features for that ride.	Built, with Razorpay; campaigns from the marketing studio
Tour operators and clubs	Operator dashboard for paid tours: riders, back-up vehicle, alerts, messaging.	Next (concept)
Partners	Opt-in offers for safe riders: insurance renewals, roadside assistance, certified helmets and gear. The rider score now exists (private, 0–100); riders would share it once, never their rides.	Next (score built)
Events	Discover and join public rides and club events; featured listings for organisers.	Next (concept)
Fleets and delivery riders	Safety and check-ins for companies with riders on the road.	Explore
Road-safety insights	Aggregated, anonymous hazard and hard-brake hot spots for road authorities and city partners (always rounded, 10+ riders).	Explore

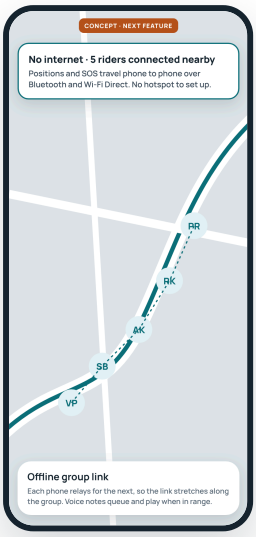

Cost structure

The heavy logic (crash detection, fuel, route guidance) runs on riders' phones, and the server mostly relays messages. Today it runs on two always-free Oracle Cloud VMs; the next step is a load test that sets how many live riders they carry (current estimate 200–700 live riders) before paid capacity is needed.

9 · ROADMAP AND NEXT FEATURES

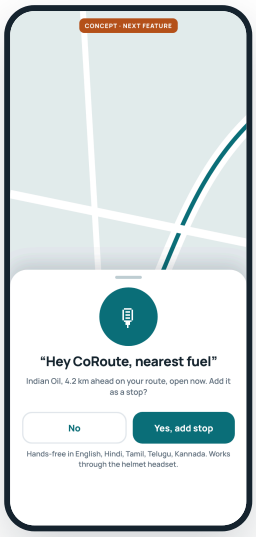

Where CoRoute goes next

NEXT · CONCEPT

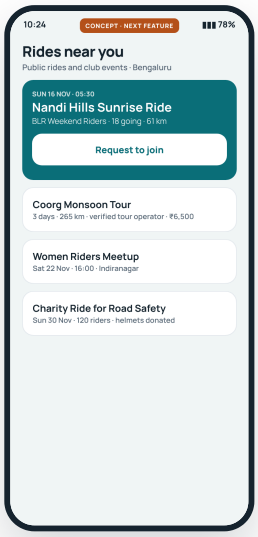

Offline group link phone to phone (Bluetooth / Wi-Fi Direct)

NEXT · CONCEPT

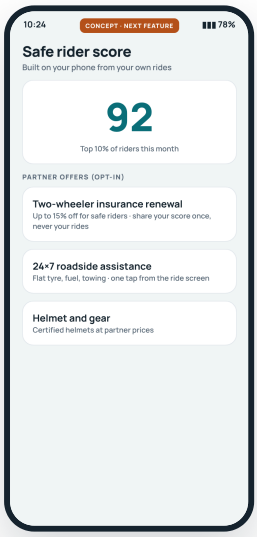

"Hey CoRoute" voice assistant in Indian languages

NEXT · CONCEPT

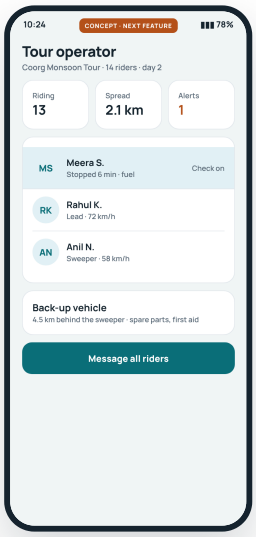

Public rides and club events

NEXT · CONCEPT

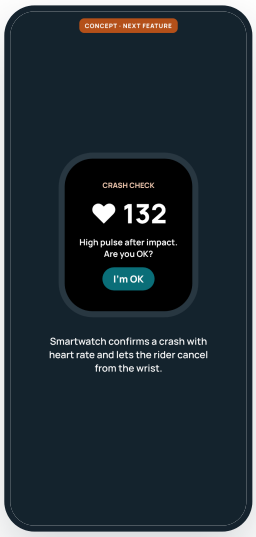

Partner offers for safe riders (the score itself is built in 3.55)

NEXT · CONCEPT

Tour operator dashboard

NEXT · CONCEPT

Smartwatch crash confirmation

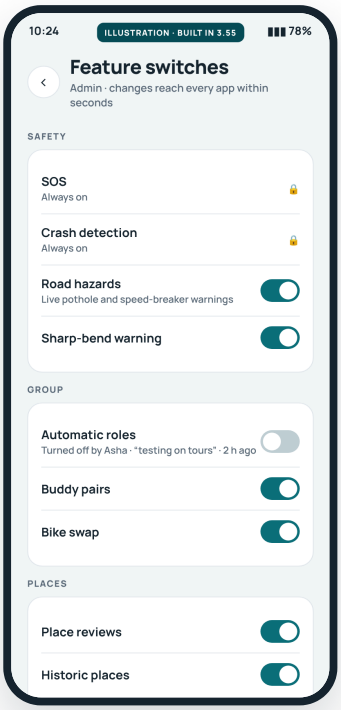

Moved to built in 3.55: rider score (was "safe rider score"), friends, crews with polls, crew ride invitations, push notifications, own domain, public leaderboards, marketing studio for campaigns, all-time website numbers.

NEXT 3 MONTHS	6–12 MONTHS
Play Store launch · iPhone (TestFlight → App Store) · real-road tuning of sensors, siren and horn detection, and intercom voice cleanup on several phones · switch links to coroute.devmonks.space (built; old address kept as fallback) · load test and paid capacity plan	Offline phone-to-phone link · voice assistant · public events and tour operators · partner offers built on the rider score · coupon applied straight from the campaign QR link · smartwatch · more Indian languages

Riders bring riders

- **Riding clubs first.** One host brings 5–11 riders who join free; every group ride is a demo of the product. Clubs live on as **crews** in the app, planning the next ride with polls.
- **Invites that travel.** Every rider has a personal friend link; it opens the app or the download page and turns into a friend request after sign-up.
- **Free safety as the hook.** Solo riders adopt for crash detection and guardian; they upgrade when they start hosting groups.
- **Community content.** Rider stories, place reviews and road reports make CoRoute more useful in every new region.
- **Trust through transparency.** The website shows all-time real totals (riders, hours, kilometres, rides, SOS resolved), never inflated numbers, and public leaderboards by username.
- **Campaigns in minutes.** The admin marketing studio turns a live coupon into post, status and banner images with a QR code and caption.
- **Moments that matter.** Monsoon rides, Ladakh season, festival weekends, road-safety campaigns with clubs and helmet brands.

BUILT IN 3.55 · ILLUSTRATION

Admin console: switch any feature off live if it misbehaves

Success measures we track (admin console, staff excluded)

Weekly riders · rides completed · Community-to-group conversion · friend invites accepted · riders in crews · share of riders with a rider score · crash false-alarm rate · SOS acknowledged within 2 minutes · Play Store rating.

Ready for its first real riders

Status (November 2026)

- v3.55 code-complete across app, server and website: sound, calls and live settings (native audio code still to compile and phone-test) and the community round (usernames, friends, crews, rider score, leaderboards, marketing studio, bike markers, pillion seat; screens to check on phones), plus crew ride invitations, push notifications and the move to our own domain coroute.devmonks.space.
- Nov 9 product decisions built: sirens for riders with earbuds, medical info always available to responders in an emergency, hold-to-send SOS in the missing-rider check, one host plan per group ride, clearer Trip owner / Trip head / Lead roles.
- All 904 automated server tests pass (Nov 9); app logic covered by pure Dart tests; code analysis clean.
- Next: final build, real-road testing, production deploy, Play Store.

Key risks and how we handle them

- **Gaming the score or misuse** → speed never rewarded; 3 server-recorded rides for the public board; implausible rides never count; friends-only crews, no chat, silent blocks, admin moderation.
- **False alarms** from phone sensors or the microphone → conservative thresholds, per-bike learning, 0 false alarms in synthetic sound tests so far, real-road tuning before launch; every sound feature has an admin switch.
- **Patchy map data** in rural India → features degrade gracefully; rider reports fill gaps.
- **Store review** of background location and SMS → permissions documented and justified.

The ask

[To be completed by the founders]

Amount · use of funds (launch and growth, device testing, iOS, team) · milestones for the next 12 months.

Contact

CoRoute · coroute.devmonks.space
[Founder name, e-mail, phone]

More risks

- **Scale** → load test, then paid capacity as riders grow.
- **A feature misbehaves** → admins switch it off for everyone in seconds; SOS and crash detection can never be switched off.

About the pictures. REAL APP SCREENSHOT taken from the app on an Android emulator. APP DESIGN SCREEN the design the app is built to (sample names and numbers). ILLUSTRATION · BUILT IN 3.55 drawn to show a feature that is built in version 3.55 (final screens may differ slightly). MOCK-UP · BUILT IN 3.55 a mock-up of a 3.55 screen drawn from the app's code and wording; not a screenshot. CONCEPT · NEXT FEATURE an idea for a future version; not built yet.
